

Subject:
Work on foundation piles Koningin Julianaplein

Dear reader,

Two drilling rigs were erected on site in week 33. These rigs will be used to place over 225 foundation piles. A number of these piles have a fall distance covering the walking paths and the 1st floor of the Stichthage facade. The piles close to New Babylon have a fall distance covering the walking paths, not the facade.

What to expect?

Hoisting moments will be as described in the hoisting protocols that were sent to you at an earlier stage. Each day about 4 piles will be placed by each drilling rig. If the fall distance covers a walking path or a facade traffic controllers will be employed to guarantee safety. The environmental manager or the traffic controller will contact you 2 days before your company falls within the fall distance.

The first pile with a fall distance outside the building pit will be placed in the corner of Rijnstraat/Stichthage, on Tuesday, August 22. This rig will continue in stages alongside the Stichthage facade. The other drilling rig will have a circular sequence of operations in the area in front of New Babylon.

Piling works are expected to continue up to the end of October.

If you have any questions left after reading this newsletter feel free to contact me.
