Excavation work Koningin Julianaplein

Dear reader,

I hereby inform you about the start of excavation work on the underground bicycle storage facility underneath the Koningin Julianaplein.

Excavation of the building site

The building site is excavated in two stages (see Figure 1). Phase 1 is the work area at the Bezuidenhoutseweg. The excavation of this phase begins in week 43 and lasts until the end of 2017. Phase 2 is the Stichthage / Rijnstraat work area. The start of this excavation is scheduled for February 2018.

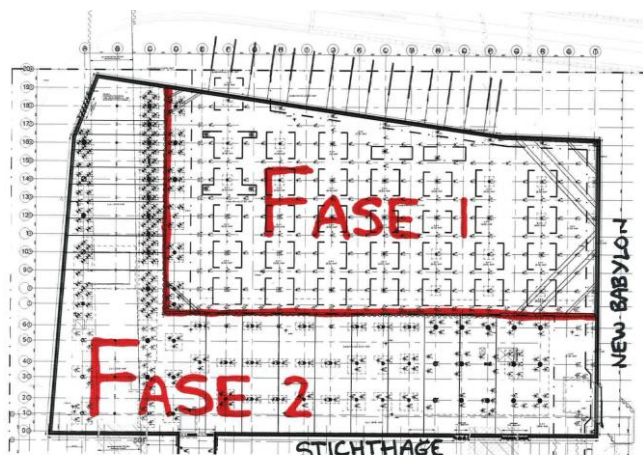

Figure 1. Overview excavation and pumping

During excavation, there are several excavators in the construction site. They create trucks full of land. There are about 6 trucks per hour driving the building site up and down (see figure 2)..

Pumping out water

In order to excavate the building site, the groundwater level in the building site is temporarily reduced. For this purpose, 8 drainage tubes have now been placed in phase 1 workgroup. Electric pumps will continuously pumping out water. These pumps are hardly audible in the area.

Level indicators are placed in the building site and in the area, so that groundwater levels are monitored.

Contact

Please do not hesitate to contact us, should you have any questions as a result of this letter. You can use the contact form on our www.kj-plein.nl website.

With Kind Regards,

Mrs Eva Zonneveld
